

Tanisha Rajgor

Availability: Full-time starting June 2027

Boston, MA | 508-905-9692 | tanisha.rajgor@gmail.com | [LinkedIn](#) | [Portfolio](#) | [GitHub](#)

EDUCATION

Cornell University

Candidate for M.Eng. Computer Science

Aug 2026 - Expected May 2027

Relevant Coursework: Reinforcement Learning, Systems Programming (Rust), Quantum Computing, Systems for Large-Scale ML

Northeastern University

B.S. Computer Science, concentration in Artificial Intelligence

Sep 2022 - May 2026

- GPA: 3.9/4.0, Dean's List, Khoury College of Computer Sciences, NCWIT Collegiate Finalist
- Publications: Harnessing Information Visualization as a Vehicle for Translational Design | [Demo](#), [Paper](#)
- Relevant Coursework: Algorithms & Data Structures, Large-Scale Storage & Retrieval, Engineering LLM-Integrated & Agentic Systems, Database Design, Graduate Foundations of AI, Machine Learning, NLP, OOP, Linear Algebra

SKILLS

Programming Languages: Python, Java, SQL, JavaScript, C++, C#/NET, Kotlin, HTML & CSS

Frameworks/Technologies: Git, React.js, Node.js, REST APIs, MySQL, NoSQL, MongoDB, Spark, Docker, Kubernetes, Visual Studio

Data Science/ML: NumPy, Pandas, TensorFlow, PyTorch, Keras, Matplotlib, Scikit-Learn, Jupyter Notebooks, Google Colab, AWS, GCP

WORK EXPERIENCE

Cisco

Software Engineer Intern

Jun 2026 - Aug 2026

San Jose, CA

- Improved a 5-agent proactive derisking system for network validation that analyzes historical support cases, bug reports, and issue logs to identify deployment risks for clients and recommend mitigations before production impact
- Shipped 14 production PRs using Python, LangChain and OpenAI/SLMs, contributing to agent orchestration, semantic analysis, episodic pattern learning, rule-based risk detection workflows, and feedback incorporation
- Developed a context-aware workflow recommendation system that models 83+ automated engineering skills as a DAG-based knowledge graph, mapping freeform user requests and identifying gaps for future refinement

Spotify

Software Engineer Intern

Jun 2025 - Aug 2025

New York, NY

- Designed and shipped an internal developer portal in React, TypeScript, and Node.js to explore personalized content components, enabling rapid prototyping and testing of state-driven interactions (e.g. focus, press, fallback) across Home and Browse surfaces
- Architected modular mock preview systems using MVC, Factory, and Interface patterns; authored proposal for "Explore with AiKA", a RAG-based natural language search feature to improve documentation discoverability and retrieval for internal teams
- Researched LLM-as-evaluator and candidate generation approaches for podcast/audiobook chapter segmentation; authored technical specs and feature contribution docs; collaborated cross-functionally with MLEs, PMs, and designers to scope and communicate AI-driven workflows

UKG

Software Engineer Intern

Sep 2024 - Dec 2024

Lowell, MA

- Engineered an in-house Looker extension for Cloud FinOps, enabling non-technical teams to query cloud cost dashboards through natural language, developing and fine-tuning NLP models (Word2Vec, GloVe, LSTM, Transformers)
- Built full-stack solution with React and Python via WebSockets, deployed on GCP Cloud Run using Docker, Kubernetes, and Terraform for versioned infrastructure provisioning across dev, test, and production; monitored with Grafana for observability
- Led migration of on-premises monitoring to Splunk Cloud for cluster health, managing pod/server alerts, and optimizing resource allocation to reduce downtime

Fidelity Investments

Data Engineer Intern

Jun 2024 - Aug 2024

Smithfield, RI

- Constructed and optimized data pipelines, integrating multiple, diverse sources (MorningStar, FFIO, Snowflake, FactSet API, AWS S3) to enhance data retrieval speed, accessibility, and reliability
- Developed a scalable Control-M version-control system, using Jenkins (configuration), Artifactory, Java, Python, and Git, enabling easy job draft building, file comparison, validation, and deployment, adopted by all teams, reducing manual error by 30%

PROJECTS

Immersify | [Demo](#) | [Devpost](#) | [Github](#) | (NeRFs, Unity, Docker, OpenCV)

- Bring videos to life, rendering them into 3D navigable spaces - utilizing batch pre-processing systems and Neural Radiance Fields (NeRFs), all brought together in a full-stack, user-first pipeline
- Developed a neural network model to eliminate blur and standardize frames in video for a clean, crisp, and efficient convergence
- Integrated Unity, Flask, and PostgreSQL server-side backend with custom API calls to streamline workflow
- HackMIT, HackHarvard Finalist/Interactive Media Track Runner-up - tremendous applications in VR/mixed reality, and 3D printing

Deepfake Detection with Haar Cascades & GANs | [Demo](#) | [Resources](#) | [Paper](#) | (Tensorflow, NumPy, Keras, OpenCV)

- Directed to aid in the reverse engineering of current deepfake technologies - using Haar Cascades to decrease run-time and General Adversarial Networks trained on key points in the face (eyes, nose, mouth, ears), age, gender, and ethnicity
- Creation of Histogram of Oriented Gradients through cascade operations to map out edges of face for further evaluation, authenticity prediction utilizing MesoNet, Computer Vision, and evaluation algorithms
- Presented at MIT Eurekafest, Henry Ford National Invention Convention (Worldwide) Qualifier
